

Data for Agentic AI

Data is the foundation for building AI agents

- Quality and trustworthy data is what makes any model work and provide meaningful results
- When a project or job is made of thousands of data pipelines and data from multiple sources, observability to the data work flows is critical
- Databand provides data observability

Databand helps to

- Detect and resolve data quality incidents in real-time
 - Reduce business impacts of bad data quality
 - Automate detection & root cause analysis
 - Improve data engineering efficiency & deliver

Solution component

IBM® watsonx.data® integration

IBM® Databand®

<https://www.ibm.com/case-studies/ibm-chief-data-office-databand>

Problem Statement

What happens when we are **reactive** to data issues

Many data quality issues are **overlooked**

Platform only learns about issues when **reported by data consumers**

After issues are reported, they **are not resolved quickly**

Solution

Proactive Data Observability: *Shift left* and solve problems at the source

Observe data pipeline **process quality**

- Status
- Performance
- Latency

Observe **data quality and reliability**

- *Schema changes*
- *Data shape*
- *Data freshness*

Supported **data pipelines** and **workflow managers**

- *Airflow*: Python, Spark, dbt, SQL and other operators

Databand GCDO M&A Use Cases

Business Value

Data Observability refers to dynamic monitoring, reporting, and resolving of data incidents at run time. It also provides real time monitoring on data transformation and reports on data quality too. DataBand is an IBM acquired company and the DataBand platform provides autonomous monitoring and reporting (dashboard) and recommends ways to avert / resolve data incident issues. This greatly reduces logging and manual observation / tracking of incidents. The autonomous functions of DataBand enable to realize better SLAs with customers as well as ensure better quality and trust of the data too.

Data reside on multiple clouds, multiple storage mediums
